Chapter 2

Univariate Random Variable

LECTURE 1 | 2020-09-09

Review of:

- Probability
- Random variables (discrete and continuous)
- Expectation and variance
- Moment generating function

2.1 Probability

DEFINITION 2.1.1: Probability model

A **probability model** is used for a random experiment, which consists of three components:

- (I) Sample space
- (II) Event
- (III) Probability (density) function

DEFINITION 2.1.2: Sample space

A **sample space** S is a set of all the distinct outcomes for a random experiment, with the property that in a single trial, one and only one of these outcomes occurs.

EXAMPLE 2.1.3

Toss a coin twice. This is a random experiment because we do not know the outcome before we toss the coin twice.

- $S = \{(H, H), (H, T), (T, H), (T, T)\}$

Define A : First toss is an H .

Clearly, $A = \{(H, H), (H, T)\} \subseteq S$, so A is an event.

DEFINITION 2.1.4: † Sigma algebra

A collection of subsets of a set S is called **sigma algebra**, denoted by β , if it satisfies the following properties:

- (I) $\emptyset \in \beta$
- (II) If $A \in \beta$, then $\bar{A} \in \beta$
- (III) If $A_1, A_2, \dots \in \beta$, then $\bigcup_{i=1}^{\infty} A_i \in \beta$

DEFINITION 2.1.5: Probability set function

Let β be a sigma algebra associated with the sample space S . A **probability set function** is a function P with domain β that satisfies the following axioms:

- (I) $P(A) \geq 0$ for all $A \in \beta$
- (II) $P(S) = 1$
- (III) **Additivity property:** If $A_1, A_2, A_3, \dots \in \beta$ are pairwise mutually exclusive events; that is, $A_i \cap A_j = \emptyset$ for all $i \neq j$, then

$$P\left(\bigcup_{i=1}^{\infty} A_i\right) = \sum_{i=1}^{\infty} P(A_i)$$

EXAMPLE 2.1.6

Toss a coin twice, given one event A ,

$$P(A) = \frac{\# \text{ of outcomes in } A}{4}$$

since $|S| = 4$. P satisfies the three properties, therefore P is a probability function.

PROPOSITION 2.1.7: Additional Properties of the Probability Set Function

Let β be a sigma algebra associated with the sample space S and let P be a probability set function with domain β . If $A, B \in \beta$, then:

- (1) $P(\emptyset) = 0$
- (2) If A and B are mutually exclusive events, then $P(A \cup B) = P(A) + P(B)$
- (3) $P(\bar{A}) = 1 - P(A)$
- (4) If $A \subset B$, then $P(A) \leq P(B)$

Note for (4), $A \subset B$ means $a \in A$ implies $a \in B$.

Proof of: 2.1.7

Proof of (1): Let $A_1 = S$ and $A_i = \emptyset$ for $i = 2, 3, \dots$. Since $\bigcup_{i=1}^{\infty} A_i = S$, then by (III) it follows that

$$P(S) = P(S) + \sum_{i=2}^{\infty} P(\emptyset)$$

and by (II) we have

$$1 = 1 + \sum_{i=2}^{\infty} P(\emptyset)$$

By (I) the right side is a series of non-negative numbers which must converge to the left side which is 1 which is finite which results in a contradiction unless $P(\emptyset) = 0$ as required.

Proof of (2): Let $A_1 = A$, $A_2 = B$, and $A_i = \emptyset$ for $i = 3, 4, \dots$. Since $\bigcup_{i=1}^{\infty} A_i = A \cup B$, then by (III)

$$P(A \cup B) = P(A) + P(B) + \sum_{i=3}^{\infty} P(\emptyset)$$

and since $P(\emptyset) = 0$ by the result of (1) it follows that

$$P(A \cup B) = P(A) + P(B)$$

Proof of (3): Since $S = A \cup \bar{A}$ and $A \cap \bar{A} = \emptyset$ then by (II) and by (2) it follows that

$$1 = P(S) = P(A \cup \bar{A}) = P(A) + P(\bar{A})$$

as required.

Proof of (4): Since

$$B = (A \cap B) \cup (\bar{A} \cap B) = A \cup (\bar{A} \cap B)$$

and $A \cap (\bar{A} \cap B) = \emptyset$ then by (2)

$$P(B) = P(A) + P(\bar{A} \cap B)$$

But by (I), $P(\bar{A} \cap B) \geq 0$, so the result now follows.

EXERCISE 2.1.8

Let β be a sigma algebra associated with the sample space S and let P be a probability set function with domain β . If $A, B \in \beta$ then prove the following:

1. $0 \leq P(A) \leq 1$
2. $P(A \cap \bar{B}) = P(A) - P(A \cap B)$
3. $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

1. $P(A) \geq 0$ follows from (I). From (3) we have $P(\bar{A}) = 1 - P(A)$. But from (I) $P(\bar{A}) \geq 0$ and therefore $P(A) \leq 1$.
2. Since $A = (A \cap B) \cup (A \cap \bar{B})$ and $(A \cap B) \cap (A \cap \bar{B}) = \emptyset$, then by (2)

$$P(A) = P(A \cap B) + P(A \cap \bar{B})$$

as required.

3. $P(A \cup B) = (A \cap \bar{B}) \cup (A \cap B) \cup (\bar{A} \cap B)$. By the previous result,

$$P(A \cap \bar{B}) = P(A) - P(A \cap B) \text{ and } P(\bar{A} \cap B) = P(B) - P(A \cap B)$$

Therefore,

$$\begin{aligned} P(A \cup B) &= (P(A) - P(A \cap B)) + P(A \cap B) + (P(B) - P(A \cap B)) \\ &= P(A) + P(B) - P(A \cap B) \end{aligned}$$

as required.

DEFINITION 2.1.9: Conditional probability

Let β be a sigma algebra associated with the sample space S and suppose $A, B \in \beta$ with $P(B) > 0$. Then the **conditional probability** of A given that B has occurred is

$$P(A | B) = \frac{P(A \cap B)}{P(B)}$$

DEFINITION 2.1.10: Independent events

Let β be a sigma algebra associated with the sample space S and suppose $A, B \in \beta$. A and B are **independent events** if

$$P(A \cap B) = P(A)P(B)$$

Clearly, $P(A | B) = P(A)$ if A and B are independent since

$$P(A | B) = \frac{P(A \cap B)}{P(B)} = \frac{P(A)P(B)}{P(B)} = P(A)$$

EXAMPLE 2.1.11

Toss a coin twice.

- A : First toss is H
- B : Second toss is T

$$P(A) = \frac{\# \text{ of outcomes in } A}{4} = \frac{2}{4}$$

also

$$P(B) = \frac{2}{4}$$

$$P(A \cap B) = \frac{1}{4} = P(A)P(B)$$

therefore A and B are independent.

2.2 Random Variables

DEFINITION 2.2.1: Random variable

A **random variable** X is a function from a sample space S to the real numbers \mathbb{R} ; that is,

$$X : S \rightarrow \mathbb{R}$$

satisfies for any given $x \in \mathbb{R}$ $\{X \leq x\}$ is an event.

$$\{X \leq x\} = \{\omega \in S : X(\omega) \leq x\} \subseteq S$$

EXAMPLE 2.2.2

Toss a coin twice. X : # of H in two tosses

Possible values of X : 0, 1, 2. Given $x \in \mathbb{R}$.

$$\{X \leq x\}$$

- $x < 0$ then $\{X \leq x\} = \emptyset$
- $0 \leq x < 1$ then

then

$$\{X \leq x\} = \{X = 0\} = \{(T, T)\} \subseteq S$$

therefore X is a random variable.

DEFINITION 2.2.3: Cumulative distribution function

The **cumulative distribution function** (c.d.f.) of a random variable X is defined by

$$F(x) = P(X \leq x)$$

for all $x \in \mathbb{R}$. Note that the c.d.f. is defined for all \mathbb{R}

DEFINITION 2.2.4: Properties of the cumulative distribution function

- (1) F is a non-decreasing function; that is, if $x_1 \leq x_2$, then $F(x_1) \leq F(x_2)$.

By looking at:

- $\{X \leq x_1\} \subseteq \{X \leq x_2\}$ if $x_1 \leq x_2$.

- (2) $\lim_{x \rightarrow \infty} F(x) = 1$ and $\lim_{x \rightarrow -\infty} F(x) = 0$.

By looking at:

- $x \rightarrow \infty$: $\{X \leq x\} \rightarrow S$
- $x \rightarrow -\infty$: $\{X \leq x\} \rightarrow \emptyset$

- (3) $F(x)$ is a right continuous function; that is, for any $a \in \mathbb{R}$,

$$\lim_{x \rightarrow a^+} F(x) = F(a)$$

- (4) For all $a < b$

$$P(a < X \leq b) = P(X \leq b) - P(X \leq a) = F(b) - F(a)$$

- (5) For all b

$$P(X = b) = P(\text{jump at } b) = \lim_{t \rightarrow b^+} F(t) - \lim_{t \rightarrow b^-} F(t) = F(b) - \lim_{t \rightarrow b^-} F(t)$$

LECTURE 2 | 2020-09-09

2.3 Discrete Random Variables

DEFINITION 2.3.1: Discrete random variable

If a random variable X can only take finite or countable values, X is a **discrete random variable**.

In this case, $F(x)$ is a right-continuous step function.

REMARK 2.3.2

When we say **countable**, we mean something you can enumerate such as \mathbb{Z} or \mathbb{N}^+ .

DEFINITION 2.3.3: Probability function

If X is a discrete random variable, then the **probability function** (p.f.) of X is given by

$$f(x) = \begin{cases} P(X = x) = F(x) - \lim_{\varepsilon \rightarrow 0^+} F(x - \varepsilon) & \text{if } X \text{ can take value } x \\ 0 & \text{if } X \text{ cannot take value } x \end{cases}$$

DEFINITION 2.3.4: Support set

The set $A = \{x : f(x) > 0\}$ is called the **support set** of X . These are all the positive values X can take.

PROPOSITION 2.3.5: Properties of the Probability Function

- (1) $f(x) \geq 0$ for $x \in \mathbb{R}$
- (2) $\sum_{x \in A} f(x) = 1$

Review some commonly used discrete random variables:

- **Bernoulli.** $X \sim \text{Bernoulli}(p)$ where X can only take two possible values 0 (failure) or 1 (success). Let p be the probability of a success for a single trial. So,

$$P(X = 1) = p \text{ and } P(X = 0) = 1 - p$$

Therefore,

$$f(x) = P(X = x) = p^x(1 - p)^{1-x}$$

Example: Toss a coin twice. Let X be the number of heads. Then $X \sim \text{Bernoulli}(p)$

- **Binomial.** $X \sim \text{Binomial}(n, p)$. Suppose we have **Bernoulli Trials**:
 - We run n trials
 - Each trial is independent of each other
 - Each trial has two possible outcomes: 0 (failure), 1 (success)

$$P(X = 1) = p$$

Let X be the number of success across these n trials and p be the success probability for a single trial.

$$X = \sum_{i=1}^n X_i$$

X_i is the outcome of the i th trial.

$$P(X_i = 1) = p$$

where $X_i \sim \text{Bernoulli}(p)$. Therefore,

$$f(x) = P(X = x) = \binom{n}{x} p^x (1 - p)^{n-x}$$

- **Geometric.** $X \sim \text{Geometric}(p)$. Let X be the number of failures before the first success. X can take values $0, 1, 2, \dots$

$$f(x) = P(X = x) = (1 - p)^x p$$

Example. X = number of tails before you get the first head.

- **Negative Binomial.** $X \sim \text{NB}(r, p)$. Let X be the number of failures before you get r success. X can take values $0, 1, 2, \dots$

$$f(x) = P(X = x) = \binom{x+r-1}{x} (1-p)^x p^{r-1} p$$

Example. X = number of tails before you get the r th head.

- **Poisson.** $X \sim \text{Poisson}(\mu)$ where $X = 0, 1, \dots$

$$f(x) = P(X = x) = \frac{\mu^x}{x!} e^{-\mu}$$

where $x = 0, 1, 2, \dots$

EXERCISE 2.3.6

Verify all that all the probability models above are indeed probability functions using Proposition 2.3.5.

Solution. TODO

2.4 Continuous Random Variables**DEFINITION 2.4.1: Continuous random variable**

Suppose X is a random variable with c.d.f. F . If F is a continuous function for all $x \in \mathbb{R}$ and F is differentiable except possibly at countably many points, then X is called a **continuous random variable**.

Note that this is not a rigorous definition, but it will be used in this course.

DEFINITION 2.4.2: Probability density function, Support set

The **probability density function** (p.d.f.) of a continuous random variable is

$$f(x) = \begin{cases} F'(x) & \text{if } F(x) \text{ is differentiable at } x \\ 0 & \text{otherwise} \end{cases}$$

The set $A = \{x : f(x) > 0\}$ is called the **support set** of X .

Continuous case: $f(x) \neq P(X = x)$

$$P(x < X \leq x + \delta) \approx f(x)\delta$$

since

$$\lim_{\delta \rightarrow 0} \frac{F(x + \delta) - F(x)}{\delta} = F'(x) = f(x)$$

PROPOSITION 2.4.3: Properties of the Probability Density Function

- (1) $f(x) \geq 0$ for all $x \in \mathbb{R}$
- (2) $\int_{-\infty}^{\infty} f(x) dx = \lim_{x \rightarrow \infty} F(x) - \lim_{x \rightarrow -\infty} F(x) = 1$
- (3) $f(x) = F'(x) = \lim_{h \rightarrow 0} \frac{F(x+h) - F(x)}{h}$
- (4) $F(x) = \int_{-\infty}^x f(t) dt$ since $F(-\infty) = 0$.
- (5) $P(a < X \leq b) = P(X \leq b) - P(X \leq a) = F(b) - F(a) = \int_a^b f(x) dx$
- (6) $P(X = b) = F(b) - \lim_{a \rightarrow b^-} F(a) = F(b) - F(b) = 0 \neq f(b)$ since F is continuous.

EXAMPLE 2.4.4

Suppose the c.d.f. of X is

$$F(x) = \begin{cases} 0 & x \leq a \\ \frac{x-a}{b-a} & a < x < b \\ 1 & x \geq b \end{cases}$$

Find the p.d.f. of X .

Solution.

$$f(x) = \begin{cases} \frac{1}{b-a} & a < x < b \\ 0 & \text{otherwise} \end{cases}$$

We note that $X \sim \text{Uniform}(a, b)$

EXAMPLE 2.4.5

Let the p.d.f. be defined as follows.

$$f(x) = \begin{cases} \frac{\theta}{x^{\theta+1}} & x \geq 1 \\ 0 & x < 1 \end{cases}$$

- (i) For what values of θ is f a p.d.f.
- (ii) Find $F(x)$.
- (iii) Find $P(-2 < X < 3)$.

Solution.

- (i) Note that $\frac{\theta}{x^{\theta+1}} \geq 0$ for all $\theta \geq 0$.

Case 1: $\theta = 0$. $f(x) \equiv 0$, then f cannot be a pdf since $\int_{-\infty}^{\infty} f(x) dx = 0 \neq 1$

Case 2: $\theta > 0$.

$$\int_{-\infty}^{\infty} f(x) dx = \int_{-\infty}^1 f(x) dx + \int_1^{\infty} f(x) dx = \int_1^{\infty} \frac{\theta}{x^{\theta+1}} dx = [-x^{-\theta}]_1^{\infty} = 1$$

Therefore, f is a p.d.f. when $\theta > 0$.

- (ii) $F(x) = P(X \leq x)$.

Case 1: $x < 1$.

$$P(X \leq x) = \int_{-\infty}^x f(t) dt = 0$$

Case 2: $x \geq 1$.

$$P(X \leq x) = \int_{-\infty}^x f(t) dt = \int_{-\infty}^1 f(t) dt + \int_1^x f(t) dt = \int_1^x \frac{\theta}{t^{\theta+1}} dt = [-t^{-\theta}]_1^x = 1 - x^{-\theta}$$

- (iii) $P(-2 < X < 3)$. Either use the c.d.f. we found or the p.d.f.

Using the c.d.f. we have

$$F(3) - F(-2) = (1 - 3^{-\theta}) - 0$$

Using the p.d.f. we have

$$\int_{-2}^3 f(x) dx = \int_{-2}^1 f(x) dx + \int_1^3 f(x) dx = \int_1^3 f(x) dx = \text{exercise}$$

We first introduce a function that will be used.

DEFINITION 2.4.6: Gamma function

The **gamma function**, denoted $\Gamma(\alpha)$ for all $\alpha > 0$, is given by

$$\Gamma(\alpha) = \int_0^{\infty} x^{\alpha-1} e^{-x} dx$$

PROPOSITION 2.4.7: Properties of the Gamma Function

- (1) $\Gamma(\alpha) = (\alpha - 1)\Gamma(\alpha - 1)$ for $\alpha > 1$
- (2) $\Gamma(n) = (n - 1)!$ when $n \geq 1$ is a positive integer
- (3) $\Gamma\left(\frac{1}{2}\right) = \sqrt{\pi}$

We don't need to know the following proof, but I checked it out for fun. Content not found in the syllabus is usually labelled with a dagger (\dagger).

Proof of: \dagger 2.4.7

Proof of (1). Suppose $\alpha > 1$.

$$\Gamma(\alpha) = \int_0^{\infty} x^{\alpha-1} e^{-x} dx$$

Let $u = x^{\alpha-1} \implies du = (\alpha - 1)x^{\alpha-2} dx$ and $dv = e^{-x} dx \implies v = -e^{-x}$. Now, recall from MATH 138:

$$\int u dv = uv - \int v du$$

So,

$$\begin{aligned} \Gamma(\alpha) &= [(\alpha - 1)x^{\alpha-2} (-e^{-x})]_0^{\infty} - \int_0^{\infty} (-e^{-x}) (\alpha - 1)x^{\alpha-2} dx \\ &= 0 + (\alpha - 1) \int_0^{\infty} e^{-x} x^{\alpha-2} dx \\ &= (\alpha - 1)\Gamma(\alpha) \end{aligned}$$

Proof of (2). Using (1):

$$\begin{aligned} \Gamma(\alpha) &= (\alpha - 1)\Gamma(\alpha - 1) \\ &= (\alpha - 1)(\alpha - 2)\Gamma(\alpha - 3) \\ &= (\alpha - 1)(\alpha - 2) \cdots (3)(2)(1)\Gamma(1) \end{aligned}$$

We know that $\Gamma(1) = 1$ by using the definition (trivial), therefore the result now follows.

Proof of (3). Sketch:

- Let $u = x^2$, so $du = 2x dx$. Let $\alpha = \frac{1}{2}$, so the integral looks like:

$$\Gamma\left(\frac{1}{2}\right) = 2 \int_0^{\infty} e^{-u^2} du$$

- Compute $\left[\Gamma\left(\frac{1}{2}\right)\right]^2$. Using polar coordinates, compute the following double integral.

$$4 \int_0^{\infty} \int_0^{\infty} e^{-(u^2+v^2)} dv du$$

One will have to compute the Jacobian Matrix.

- Solve for $\Gamma\left(\frac{1}{2}\right)$ explicitly now.

Note: This was covered in MATH 237 when I took it (F19).

EXAMPLE 2.4.8

The p.d.f. is given by

$$f(x) = \begin{cases} \frac{x^{\alpha-1}e^{-x/\beta}}{\Gamma(\alpha)\beta^\alpha} & x > 0 \\ 0 & x \leq 0 \end{cases}$$

when $\alpha > 0$ and $\beta > 0$. We say that $X \sim \text{Gamma}(\alpha, \beta)$.

We also say that α is the scale parameter and β is the shape parameter for this distribution.

Verify that $f(x)$ is a p.d.f.

Solution. Showing $f(x) \geq 0$ is trivial. Now,

$$\int_{-\infty}^{\infty} f(x) dx = \int_0^{\infty} \frac{x^{\alpha-1}e^{-x/\beta}}{\Gamma(\alpha)\beta^\alpha} dx$$

Let $y = x/\beta \implies x = y\beta$ and $dx = \beta dy$. Therefore,

$$= \int_0^{\infty} \frac{y^{\alpha-1}\beta^{\alpha-1}e^{-y}}{\Gamma(\alpha)\beta^\alpha} \beta dy = \frac{1}{\Gamma(\alpha)} \int_0^{\infty} y^{\alpha-1}e^{-y} dy = 1$$

EXAMPLE 2.4.9

Suppose the p.d.f. is given by

$$f(x) = \begin{cases} \frac{\beta}{\theta^\beta} x^{\beta-1} e^{-(x/\theta)^\beta} & x > 0 \\ 0 & x \leq 0 \end{cases}$$

with $\alpha > 0$ and $\beta > 0$. Then, $X \sim \text{Weibull}(\theta, \beta)$. Verify that $f(x)$ is a p.d.f.

Solution. $f(x) \geq 0$ for every $x \in \mathbb{R}$. Now,

$$\int_{-\infty}^{\infty} f(x) dx = \int_0^{\infty} \frac{\beta}{\theta^\beta} x^{\beta-1} e^{-(x/\theta)^\beta} dx$$

Let $y = (x/\theta)^\beta \implies x = \theta y^{1/\beta}$ and $dx = \frac{\theta}{\beta} y^{(1/\beta)-1} dy$. Therefore,

$$= \int_0^{\infty} \frac{\beta}{\theta^\beta} \theta^{\beta-1} y^{(\beta-1)/\beta} e^{-y} \frac{\theta}{\beta} y^{(1/\beta)-1} dy = \int_0^{\infty} e^{-y} dy = \Gamma(1) = 1$$

EXAMPLE 2.4.10: Normal

The p.d.f. is given by

$$f(x) = \frac{1}{\sqrt{2\pi}\sigma} \exp\left\{-\frac{(x-\mu)^2}{2\sigma^2}\right\}$$

$x \in \mathbb{R}$, $-\infty < \mu < \infty$, $\sigma^2 > 0$. Verify that $f(x)$ is a p.d.f.

Solution.

$f(x) \geq 0$ obviously.

Case 1: $\mu = 0$ and $\sigma^2 = 1$, then we say X follows a **standard normal** distribution. We want to show

that

$$\int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}} \exp\left\{-\frac{x^2}{2}\right\} dx = 1$$

Since the function is symmetrical around 0, we have the following equivalent integral.

$$2 \int_0^{\infty} \frac{1}{\sqrt{2\pi}} \exp\left\{-\frac{x^2}{2}\right\} dx$$

Let $y = x^2/2 \Rightarrow x = \sqrt{2y}$ and $dx = \frac{\sqrt{2}}{2} y^{-1/2} dy$. Therefore,

$$= \frac{2}{\sqrt{2\pi}} \int_0^{\infty} e^{-y} \frac{\sqrt{2}}{2} y^{-1/2} dy = \frac{1}{\sqrt{\pi}} \int_0^{\infty} y^{1/2-1} e^{-y} dy = \left(\frac{1}{\sqrt{\pi}}\right) \Gamma\left(\frac{1}{2}\right) = 1$$

Case 2: For general μ and σ^2 ,

$$\int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}\sigma} \exp\left\{-\frac{(x-\mu)^2}{2\sigma^2}\right\} dx$$

Let $z = \frac{x-\mu}{\sigma} \Rightarrow x = \mu + \sigma z$ and $dx = \sigma dz$. Therefore,

$$= \int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}\sigma} \exp\left\{-\frac{z^2}{2}\right\} \sigma dz = \int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}} \exp\left\{-\frac{z^2}{2}\right\} dz = 1$$

using Case 1.

2.7 Expectation

DEFINITION 2.7.1: Expectation of discrete random variable

Suppose X is a discrete random variable with support A and p.f. $f(x)$. Then,

$$\mathbf{E}[X] = \sum_{x \in A} x f(x)$$

if $\sum_{x \in A} |x| f(x) < \infty$ (finite). If $\sum_{x \in A} |x| f(x) = \infty$ (infinite), then $\mathbf{E}[X]$ does not exist.

DEFINITION 2.7.2: Expectation of continuous random variable

Suppose X is a continuous random variable with support A and p.d.f. $f(x)$. Then,

$$\mathbf{E}[X] = \int_{-\infty}^{\infty} x f(x) dx$$

if $\int_{-\infty}^{\infty} |x| f(x) dx < \infty$ (finite). Similarly, if $\int_{-\infty}^{\infty} |x| f(x) dx = \infty$ (infinite), then $\mathbf{E}[X]$ does not exist.

EXAMPLE 2.7.3: Discrete

Suppose

$$f(x) = \frac{1}{x(x+1)} = \frac{1}{x} - \frac{1}{x+1}$$

for $x = 1, 2, \dots$. The support set is $A = \{1, 2, \dots\}$. We note that $f(x)$ is a p.f. since $f(x) \geq 0$ and

$$\sum_{x \in A} f(x) = \sum_{x=1}^{\infty} \left(\frac{1}{x} - \frac{1}{x+1} \right) = 1 - \frac{1}{2} + \frac{1}{2} - \frac{1}{3} + \dots = 1$$

Find $\mathbf{E}[X]$.

Solution.

$$\sum_{x \in A} |x|f(x) = \sum_{x=1}^{\infty} x \left(\frac{1}{x} - \frac{1}{x+1} \right) = \sum_{x=1}^{\infty} \frac{1}{x+1} = \infty$$

Therefore, $\mathbf{E}[X]$ does not exist!

EXAMPLE 2.7.4: Continuous

Let the p.d.f. be defined as $f(x) = \frac{1}{x^2 + 1}$ for $x \in \mathbb{R}$. This is known as the Cauchy distribution (or Student's T-distribution with 1 degree of freedom). Find $\mathbf{E}[X]$.

Solution.

$$\int_{-\infty}^{\infty} |x|f(x) dx = \int_{-\infty}^{\infty} |x| \frac{1}{x^2 + 1} dx = 2 \int_0^{\infty} \frac{x}{x^2 + 1} dx = [\ln|x^2 + 1|]_0^{\infty} = \infty$$

$\mathbf{E}[X]$ does not exist! The following is wrong:

$$\mathbf{E}[X] = \int_{-\infty}^{\infty} xf(x) dx = \int_{-\infty}^{\infty} \frac{x}{1 + x^2} dx = 0$$

since the integral above with $|x|$ is infinite. You must always remember to check that the $\mathbf{E}[X]$ is finite (using $|X|$) for both the discrete and continuous case.

EXAMPLE 2.7.5: Bernoulli and Binomial Random Variable

Suppose $X \sim \text{Bernoulli}(p)$.

$$P(X = 1) = p \text{ and } P(X = 0) = 1 - p$$

We know $\mathbf{E}[X] = (1)P(X = 1) + (0)P(X = 0) = p$

Now suppose $X \sim \text{Binomial}(n, p)$. Find $\mathbf{E}[X]$.

Solution.

$$\mathbf{E}[X] = \sum_{x \in A} xf(x) = \sum_{x=0}^n x \binom{n}{x} p^x (1-p)^{n-x}$$

This is hard to do. But, we know we can use the relationship between the Binomial and Bernoulli random variable so,

$$X = \sum_{i=1}^n X_i$$

Therefore,

$$\mathbf{E}[X] = \left(\sum_{i=1}^n X_i \right) = \sum_{i=1}^n \mathbf{E}[X_i] = np$$

EXAMPLE 2.7.6

Suppose for a random variable X the p.d.f. is given by $f(x) = \frac{\theta}{x^{\theta+1}}$ for $x \geq 1$ and 0 when $x < 1$.

Assume $\theta > 0$. Find $\mathbf{E}[X]$ and for what values of θ , does $\mathbf{E}[X]$ exist.

Solution.

$$\int_{-\infty}^{\infty} |x|f(x) dx = \int_1^{\infty} (x) \frac{\theta}{x^{\theta+1}} dx = \theta \int_1^{\infty} \frac{1}{x^{\theta}} dx < \infty \iff \theta > 1$$

from MATH 138. So, if $\theta > 1$ then $\mathbf{E}[X]$ exists. Also,

$$\mathbf{E}[X] = \int_{-\infty}^{\infty} xf(x) dx = \int_1^{\infty} \frac{\theta x}{x^{\theta+1}} dx = \theta \int_1^{\infty} \frac{1}{x^{\theta}} dx = \frac{\theta}{\theta - 1}$$

DEFINITION 2.7.7: Expectation (Discrete)

If X is a discrete random variable with probability function $f(x)$ and support set A , then the **expectation** of the random variable $g(X)$ is defined by

$$\mathbf{E}[g(X)] = \sum_{x \in A} g(x)f(x)$$

provided the sum converges absolutely; that is, provided

$$\sum_{x \in A} |g(x)|f(x) < \infty$$

DEFINITION 2.7.8: Expectation (Continuous)

If X is a continuous random variable with p.d.f. $f(x)$ and support set A , then the **expectation** of the random variable $g(X)$ is defined by

$$\mathbf{E}[g(X)] = \int_{-\infty}^{\infty} g(x)f(x) dx$$

provided the integral converges absolutely; that is, provided

$$\int_{-\infty}^{\infty} |g(x)|f(x) dx < \infty$$

THEOREM 2.7.9: Expectation is a Linear Operator

Suppose X is a random variable with probability (density) function $f(x)$, and a and b are real constants, and $g(x)$ and $h(x)$ are real-valued functions. Then,

$$\mathbf{E}[aX + b] = a\mathbf{E}[X] + b$$

$$\mathbf{E}[ag(X) + bh(X)] = a\mathbf{E}[g(X)] + b\mathbf{E}[h(X)]$$

Proof of: 2.7.9

Omitted from the lecture and hence these notes. See Course Notes for most of the proof.

DEFINITION 2.7.10: Variance

The variance of a random variable is defined as

$$\sigma^2 = \text{Var}[X] = \mathbf{E}[(X - \mu)^2]$$

where $\mu = \mathbf{E}[X]$.

DEFINITION 2.7.11: Special Expectations

(I) The mean of a random variable

$$\mathbf{E}[X] = \mu$$

(II) The k th moment (about the origin) of a random variable

$$\mathbf{E}[X^k]$$

(III) The k th moment about the mean of a random variable

$$\mathbf{E}[(X - \mu)^k]$$

(IV) † The k th factorial of a random variable

$$\mathbf{E}[X^{(k)}] = \mathbf{E}[X(X-1)\cdots(X-k+1)]$$

(V) The variance of a random variable

$$\text{Var}[X] = \mathbf{E}[(X - \mu)^2] = \sigma^2$$

where $\mu = \mathbf{E}[X]$.

THEOREM 2.7.12: Properties of Variance

If X is a random variable, then

$$\text{Var}[X] = \mathbf{E}[X^2] - \mu^2$$

where $\mu = \mathbf{E}[X]$. Note that the variance of X exists if $\mathbf{E}[X^2] < \infty$

Proof of: 2.7.12

Omitted from the lecture and hence these notes. See Course Notes for most of the proof.

EXAMPLE 2.7.13

Suppose $X \sim \text{Poisson}(\theta)$, the p.f. is defined as $f(x) = \frac{\theta^x}{x!}e^{-\theta}$ for $x = 0, 1, 2, \dots$. Find $\mathbf{E}[X]$ and $\text{Var}[X]$.

Solution.

$$\sum_{x=0}^{\infty} |x| f(x) < \infty$$

Therefore,

$$\mathbf{E}[X] = \sum_{x=0}^{\infty} x \frac{\theta^x}{x!} e^{-\theta} = \sum_{x=1}^{\infty} \frac{x}{x!} \theta^x e^{-\theta} = \theta \sum_{x=1}^{\infty} \frac{\theta^{x-1}}{(x-1)!} e^{-\theta}$$

Let $y = x - 1$, then

$$\mathbf{E}[X] = \theta \sum_{y=0}^{\infty} \frac{\theta^y}{y!} e^{-\theta}$$

We know $e^{\theta} = \sum_{y=0}^{\infty} \frac{\theta^y}{y!}$, so $\mathbf{E}[X] = \theta$.

$$\mathbf{Var}[X] = \mathbf{E}[X^2] - \mu^2$$

Let's find $\mathbf{E}[X^2]$:

$$\begin{aligned} \mathbf{E}[X^2] &= \sum_{x=0}^{\infty} x^2 \frac{\theta^x}{x!} e^{-\theta} \\ &= \sum_{x=1}^{\infty} \frac{x}{(x-1)!} \theta^x e^{-\theta} \\ &= \sum_{x=1}^{\infty} \frac{(x-1) + 1}{(x-1)!} \theta^x e^{-\theta} \\ &= \sum_{x=1}^{\infty} \frac{x-1}{(x-1)!} \theta^x e^{-\theta} + \sum_{x=1}^{\infty} \frac{1}{(x-1)!} \theta^x e^{-\theta} \end{aligned}$$

Looking at the first sum (since the second sum was computed before):

$$\sum_{x=2}^{\infty} \frac{\theta^2}{(x-2)!} \theta^{x-2} e^{-\theta} + \theta$$

Let $y = x - 2$:

$$\mathbf{E}[X^2] = \sum_{y=0}^{\infty} \frac{\theta^2 \theta^y}{y!} e^{-\theta} + \theta = \theta^2 + \theta$$

Therefore,

$$\mathbf{Var}[X] = \mathbf{E}[X^2] - \mu^2 = (\theta^2 + \theta) - \theta^2 = \theta$$

LECTURE 4 | 2020-09-14

EXAMPLE 2.7.14

If $X \sim \text{Gamma}(\alpha, \beta)$, prove that

$$\mathbf{E}[X^p] = \frac{\beta^p \Gamma(\alpha + p)}{\Gamma(\alpha)}$$

for $p > -\alpha$.

Solution. Recall that

$$f(x) = \begin{cases} \frac{x^{\alpha-1} e^{-x/\beta}}{\Gamma(\alpha) \beta^{\alpha}} & x > 0 \\ 0 & x \leq 0 \end{cases}$$

So,

$$\mathbf{E}[X^p] = \int_{-\infty}^{\infty} x^p f(x) dx = \int_0^{\infty} x^p \frac{x^{\alpha-1} e^{-x/\beta}}{\Gamma(\alpha) \beta^{\alpha}} dx$$

There are two methods to solve this integral:

Method 1: Rewrite the function as the p.d.f. of a gamma distribution.

$$= \int_0^\infty \frac{x^{p+\alpha-1} e^{-x/\beta}}{\Gamma(\alpha)\beta^\alpha} dx$$

which is close to the p.d.f. of $\text{Gamma}(p + \alpha, \beta)$.

$$= \int_0^\infty \frac{x^{p+\alpha-1} e^{-x/\beta}}{\Gamma(\alpha + p)\beta^{\alpha+p}} \times \underbrace{\frac{\Gamma(\alpha + p)\beta^{\alpha+p}}{\Gamma(\alpha)\beta^\alpha}}_{\text{constant}} dx = \frac{\Gamma(\alpha + p)\beta^p}{\Gamma(\alpha)} \times 1$$

Method 2: Rewrite the function as a gamma function.

$$\mathbf{E}[X^p] = \int_0^\infty \frac{x^{(p+\alpha)-1} e^{-x/\beta}}{\Gamma(\alpha)\beta^\alpha} dx$$

Let $y = x/\beta \implies x = \beta y$ and $dx = \beta dy$. Therefore,

$$= \int_0^\infty \frac{\beta^{p+\alpha-1} y^{(p+\alpha)-1} e^{-y}}{\Gamma(\alpha)\beta^\alpha} (\beta) dy = \frac{\beta^p}{\Gamma(\alpha)} \int_0^\infty y^{(p+\alpha)-1} e^{-y} dy = \frac{\Gamma(p + \alpha)}{\Gamma(\alpha)} \beta^p$$

Additionally,

- $\mathbf{E}[X] = \frac{\beta\Gamma(\alpha + 1)}{\Gamma(\alpha)} = \alpha\beta$
- $\mathbf{E}[X^2] = \frac{\beta^2\Gamma(\alpha + 2)}{\Gamma(\alpha)} = \frac{\beta^2(\alpha + 1)\Gamma(\alpha + 1)}{\Gamma(\alpha)} = \alpha(\alpha + 1)\beta^2$
- $\mathbf{Var}[X] = \mathbf{E}[X^2] - \mu^2 = \alpha(\alpha + 1)\beta^2 - \alpha^2\beta^2 = \alpha\beta^2$

2.10 Moment Generating Functions

DEFINITION 2.10.1: Moment generating function

Suppose X is a random variable, then

$$M(t) = \mathbf{E}[e^{tX}]$$

is called the **moment generating function** (m.g.f.) of X if $M(t)$ exists for $(-h, h)$ with some $h > 0$.

REMARK 2.10.2

If we are able to find some $h > 0$ such that for any $t \in (-h, h)$,

$$\mathbf{E}[e^{tX}] < \infty$$

say $M(t)$ is the m.g.f. of X .

EXAMPLE 2.10.3

Suppose $X \sim \text{Gamma}(\alpha, \beta)$. Find $M(t)$. Recall the p.d.f. is

$$f(x) = \begin{cases} \frac{x^{\alpha-1} e^{-x/\beta}}{\Gamma(\alpha)\beta^\alpha} & x > 0 \\ 0 & x \leq 0 \end{cases}$$

Solution.

$$\begin{aligned}
 M(t) &= \mathbf{E}[e^{tX}] \\
 &= \int_{-\infty}^{\infty} e^{tx} f(x) dx \\
 &= \int_0^{\infty} e^{tx} \cdot \frac{x^{\alpha-1} e^{-x/\beta}}{\Gamma(\alpha)\beta^\alpha} dx \\
 &= \int_0^{\infty} \frac{x^{\alpha-1} e^{-x(\frac{1}{\beta}-t)}}{\Gamma(\alpha)\beta^\alpha} dx \\
 &= \int_0^{\infty} \frac{x^{\alpha-1} e^{-x/\tilde{\beta}}}{\Gamma(\alpha)\beta^\alpha} dx
 \end{aligned}$$

where

$$\tilde{\beta} = \frac{1}{\left(\frac{1}{\beta} - t\right)}$$

Continuing,

$$\begin{aligned}
 &= \int_0^{\infty} \frac{x^{\alpha-1} e^{-x/\tilde{\beta}}}{\Gamma(\alpha)\tilde{\beta}^\alpha} \cdot \frac{\tilde{\beta}^\alpha}{\beta^\alpha} dx \\
 &= \frac{\tilde{\beta}^\alpha}{\beta^\alpha} \times 1 \\
 &= (1 - \beta t)^{-\alpha}
 \end{aligned}$$

The moment generating function must be non-negative since $1 - \beta t > 0$ and therefore, $t < 1/\beta$. Take $h = 1/\beta$.

EXAMPLE 2.10.4

If $X \sim \text{Poisson}(\theta)$, the p.f. is given by $f(x) = \frac{\theta^x e^{-\theta}}{x!}$ for $x = 0, 1, 2, \dots$. Find $M(t)$.

Solution.

$$\begin{aligned}
 M(t) &= \mathbf{E}[e^{Xt}] \\
 &= \sum_{x=0}^{\infty} e^{tx} \frac{\theta^x e^{-\theta}}{x!} \\
 &= \sum_{x=0}^{\infty} \frac{(e^t \theta)^x e^{-\theta}}{x!} \\
 &= e^{-\theta} \sum_{x=0}^{\infty} \frac{(e^t \theta)^x}{x!} \\
 &= e^{-\theta} \exp\{e^t \theta\} \\
 &= \exp\{\theta(e^t - 1)\}
 \end{aligned}$$

for all $t \in \mathbb{R}$.

Three important properties of $M(t)$.

THEOREM 2.10.5: Moment Generating Function of a Linear Function

Suppose the random variable X has moment generating function $M_X(t)$ defined for $t \in (-h, h)$ for some $h > 0$. Let $Y = aX + b$ where $a, b \in \mathbb{R}$ and $a \neq 0$. Then, the moment generating function of Y is

$$M_Y(t) = e^{bt} M_X(at)$$

for $|t| < \frac{h}{|a|}$.

Proof of: 2.10.5

$$\begin{aligned} M_Y(t) &= \mathbf{E} [e^{tY}] \\ &= \mathbf{E} [e^{t(aX+b)}] \\ &= e^{bt} \mathbf{E} [e^{atX}] && \text{exists for } |at| < h \\ &= e^{bt} M_X(at) && \text{for } |t| < \frac{h}{|a|} \end{aligned}$$

as required.

EXAMPLE 2.10.6

- (i) If $Z \sim N(0, 1)$, find $M_Z(t)$.
- (ii) If $X \sim N(\mu, \sigma^2)$, find $M_X(t)$.

Solution.

(i)

$$\begin{aligned} M_Z(t) &= \mathbf{E} [e^{tZ}] \\ &= \int_{-\infty}^{\infty} e^{tx} \cdot \frac{1}{\sqrt{2\pi}} \exp \left\{ -\frac{x^2}{2} \right\} dx \\ &= \int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}} \exp \left\{ -\frac{x^2 - 2tx}{2} \right\} dx \\ &= \int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}} \exp \left\{ -\frac{(x-t)^2 - t^2}{2} \right\} dx && \text{complete the square} \\ &= \exp \left\{ \frac{t^2}{2} \right\} \int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}} \exp \left\{ -\frac{(x-t)^2}{2} \right\} dx \end{aligned}$$

where the integral is the p.d.f. of $N(\mu = t, \sigma^2 = 1)$. Therefore,

$$\mathbf{E} [e^{tZ}] = \exp \left\{ \frac{t^2}{2} \right\}$$

- (ii) $X = \sigma Z + \mu$ where $Z \sim N(0, 1)$.

$$\begin{aligned} M_X(t) &= e^{\mu t} M_Z(\sigma t) \\ &= e^{\mu t} \cdot \exp \left\{ \frac{(\sigma t)^2}{2} \right\} \\ &= \exp \left\{ \frac{(\sigma t)^2}{2} + \mu t \right\} \end{aligned}$$

THEOREM 2.10.7: Moments from Moment Generating Function

Suppose the random variable X has moment generating function $M(t)$ defined for $t \in (-h, h)$ for some $h > 0$. Then, $M(0) = 1$ and

$$M^{(k)}(0) = \mathbf{E}[X^k]$$

for $k = 1, 2, \dots$ where

$$M^{(k)}(t) = \frac{d^k}{dt^k} [M(t)]$$

is the k th derivative of $M(t)$.

Proof of: 2.10.7

Omitted from the lecture and hence these notes. See Course Notes for most of the proof.

EXAMPLE 2.10.8

Gamma(α, β) has m.g.f. $M(t) = (1 - \beta t)^{-\alpha}$ for $t < 1/\beta$. What is $\mathbf{E}[X]$ and $\mathbf{Var}[X]$?

Solution. For $\mathbf{E}[X]$ we find $M'(t)$.

$$M'(t) = (-\alpha)(1 - \beta t)^{-\alpha-1}(-\beta) = (\alpha\beta)(1 - \beta t)^{-\alpha-1}$$

We know,

$$\mathbf{E}[X] = M'(0) = \alpha\beta$$

For $\mathbf{Var}[X]$ we find $M''(t)$.

$$M''(t) = (\alpha\beta)(-\alpha-1)(-\beta)(1 - \beta t)^{-\alpha-2}$$

Now, $M''(0) = \alpha\beta^2(\alpha+1) = \mathbf{E}[X^2]$. Therefore,

$$\mathbf{Var}[X] = \mathbf{E}[X^2] - \mu^2 = \alpha\beta^2(\alpha+1) - (\alpha\beta)^2 = \alpha\beta^2$$

EXAMPLE 2.10.9

The m.g.f. of Poisson(θ) is $M(t) = \exp\{\theta(e^t - 1)\}$. Find $\mathbf{E}[X]$ and $\mathbf{Var}[X]$.

Solution.

$$M'(t) = \exp\{\theta(e^t - 1)\} \theta e^t$$

Therefore,

$$\mathbf{E}[X] = M'(0) = \theta$$

Now,

$$M''(t) = \exp\{\theta(e^t - 1)\} \theta^2 e^{2t} + \theta e^t \exp\{\theta(e^t - 1)\}$$

Therefore,

$$M''(0) = \mathbf{E}[X^2] = \theta^2 + \theta$$

So,

$$\mathbf{Var}[X] = \mathbf{E}[X^2] - \mu^2 = \theta^2 + \theta - (\theta)^2 = \theta$$

THEOREM 2.10.10: Uniqueness Theorem for Moment Generating Functions

Suppose the random variable X has moment generating function $M_X(t)$ and the random variable Y has moment generating function $M_Y(t)$. $M_X(t) = M_Y(t)$ for all $t \in (-h, h)$ for some $h > 0$ if and only if X and Y have the same distribution; that is,

$$P(X \leq s) = F_X(s) = F_Y(s) = P(Y \leq s)$$

for all $s \in \mathbb{R}$.

EXAMPLE 2.10.11

Suppose X has m.g.f. $M_X(t) = \exp \left\{ \frac{t^2}{2} \right\}$.

- (i) Find m.g.f. of $Y = 2X - 1$
- (ii) Find $\mathbf{E}[Y]$ and $\mathbf{Var}[Y]$
- (iii) What is the distribution of Y .

Solution.

(i) $M_Y(t) = e^{-t} \exp \left\{ \frac{(2t)^2}{2} \right\} = \exp \{2t^2 - t\}.$

(ii)

$$M'_Y(t) = \exp \{2t^2 - t\} (4t - 1)$$

Therefore,

$$\mathbf{E}[Y] = M'_Y(0) = -1$$

Also,

$$M''_Y(t) = \exp \{2t^2 - t\} (4t - 1)^2 + 4 \exp \{2t^2 - t\}$$

and

$$\mathbf{E}[Y^2] = M''_Y(0) = 1 + 4 = 5$$

Therefore,

$$\mathbf{Var}[Y] = \mathbf{E}[Y^2] - \mu^2 = 5 - 1 = 4$$

- (iii) $M_Y(t) = \exp \{2t^2 - t\}$ is the m.g.f. of $N(-1, 4)$ since if $X \sim N(\mu, \sigma^2)$, then (by previous example)

$$M_X(t) = e^{\mu t} \exp \left\{ \frac{\sigma^2 t^2}{2} \right\}$$
